

# ITI Project report

## Things to do

1. I have made one Database and two tables  
One to log in and one for the data my plan is to separate the Login table with the database and i am planning to make Join query from the two tables by doing this and show some data but now I just show data from one table.  
**Id, User name, Password, Created at**  
**(This is just to show that i can display some data) But i have a plan to make a foreign key on the tables and make inner join sql and get data from both tables.**
2. I was having a problem in image feed path problem. Finally, I find out it was a path problem, I can display in pc but not on the Mac computer. Due to that I just able to display the image. I didn't work more about the size of the image instead I implement the delete button which can remove the image after it been downloaded on the page and database.
3. I didn't put many things on the front page Just put one pig image to show how the site is responsive instead.
